

UVA receives approximately \$22.2 million in foreign gifts across 98 total gifts from 15 total countries. These gifts stem primarily from countries like Bangladesh, Sweden, Tanzania, Switzerland, and England giving the most money total out of the 15 countries. This is in contrast to other U.S. institutions receiving large amounts of money from countries like Qatar, China, and Saudi Arabia. Compared to peer institutions in Virginia, like Virginia Tech, William and Mary, and George Mason University, we see that UVA receives significantly more money than VT and W&M, but substantially less money compared to GMU, who receives over double the amount of money UVA receives in total from Saudi Arabia alone. Considering the countries other schools receive money from like China, Qatar, and Saudi Arabia, if UVA's goal is to increase the amount of foreign gifts, developing new relationships with these countries could prove to be useful to expanding their base income. At the same time, building upon their current relationships with countries like England, France, and Sweden could help increase the amount of contracts and gifts UVA could receive due to UVA's great background in STEM and medicine, something that those countries have highly specialized industries in.

Generally, a substantial portion of foreign gifts to U.S. institutions stems from countries like Qatar, England, China, and Saudi Arabia. Qatar by far provides the most funding at \$2.7 billion, nearly double England's \$1.46 billion. The concentration of funding among a relatively small number of countries suggests that certain international markets have particularly strong relationships with U.S. higher education. Interestingly, in 5th place was Bermuda, a country that generally does not have a vast amount of wealth to send overseas like the other 4. However, when looking at the donor names, we can see funding that is associated with corporations, foundations, and a vast amount of anonymous donations that suggest this funding could be associated with the fact that Bermuda is a massive international financial center. This allows for Bermuda to show up as a country with massive donations, when in reality, it's the companies, foundations, and anonymous donors listed within the country that are providing the donations, not just the country itself.

Across all institutions the mean of \$52.2 million and median of \$6.49 million, suggesting a right-skewed distribution caused by a small number of massive gifts. With this in mind, we can look at the top 5 schools that received the most money being Carnegie Mellon University at \$1.48 billion, Cornell at \$1.29 billion, Harvard at \$955 million, MIT at \$859 million, and Yale at \$613 million. Notably, these are all extremely prestigious private schools that receive less funding from federal, state, and local governments, so they are the most likely recipients of such massive amounts of money in foreign gifts. Comparing with other public schools outside of Virginia, like University of Michigan Ann Arbor (\$287 million), UNC Chapel Hill (\$41.3 million), and University of Florida (\$24.8 million), we see UVA falls behind in foreign gifts received, especially when considering the unusually large amount of funding the State of Florida provides to its public institutions. University of Michigan received most of its funding from countries like England, Japan, Switzerland, and China, along with a variety of other countries that are decently similar to UVA's list of donors.

Compared to peer universities in Virginia, like Virginia Tech (\$11.8 million), William and Mary (\$3.38 million), and GMU (\$65.4 million), we can see some interesting statistics. UVA brings in significantly more money than VT and W&M, but is blown out of the water by GMU by far, with Saudi Arabia alone sending GMU \$54.2 million, and the UAE sending \$6.43 million. This is in stark contrast to UVA, who receives most of its money from Bangladesh, Sweden, Tanzania, Switzerland, and England. This difference suggests that UVA's lower foreign giving compared to peer institutions in Virginia is not due to a lack of funding, but rather their international relationships and partnerships. GMU has clearly had great success in attracting funding from Saudi Arabia and UAE, meaning that there could be potential for UVA to make connections with these same countries or other countries throughout the Middle East.

In order to obtain more foreign funding, UVA should pursue a two part strategy of expanding relationships in countries where they already have foreign funding coming in, while also developing new relationships that provide large amounts of funding to other U.S. institutions. Right now, UVA should prioritize countries like England, Sweden, and Bangladesh, where existing relationships already show that there are substantial sources of income coming from these countries. Along with those countries, expanding relationships with a country like France, a wealthy country with an extensive tech and healthcare industry, could match very well with UVA's impressive background in STEM and medicine. At the same time, UVA should be trying to investigate possible ways they could secure gifts from countries like Qatar, China, and Saudi Arabia, considering just how much money they have given to other institutions. In particular, they should look towards Saudi Arabia, as GMU has already demonstrated that it is possible for a Virginia based institution to secure impressive amounts of funding from Saudi Arabia.

Outside of Virginia based institutions, UVA should more closely analyze University of Michigan Ann Arbor's, a school that is lumped with UVA as being considered a "Public Ivy", connections and their relationships to their largest donors, who happen to be a lot of pharmaceutical companies. This would bode very well for UVA, who has one of the best medicine research departments in the country, along with one of the best hospitals in the state and country. Knowing this, it would be a great idea for UVA to try to expand their reach towards countries with large pharmaceutical industries, like Switzerland, Denmark, and again, Sweden.

UVA appears to have significant opportunities to increase its foreign funding. Although it currently receives substantially less than some of the largest public and private universities in the U.S., UVA has already established relationships with countries like England, Sweden, Bangladesh, and Switzerland, providing a strong foundation for expanding existing connections. At the same time, the success of universities like GMU and University of Michigan suggests that UVA could expand into new markets, such as Saudi Arabia and other countries with substantial foreign gifts to U.S. institutions, while also going for a more direct strategy of targeting specific companies and organizations that follow UVA's strengths in medicine, STEM, and research. By combining their current relationships with existing countries and a targeted campaign for other

countries and organizations, UVA has a great opportunity to expand its foreign gift giving base and increase its overall funding for the university.
